Payment plug-in installation guide

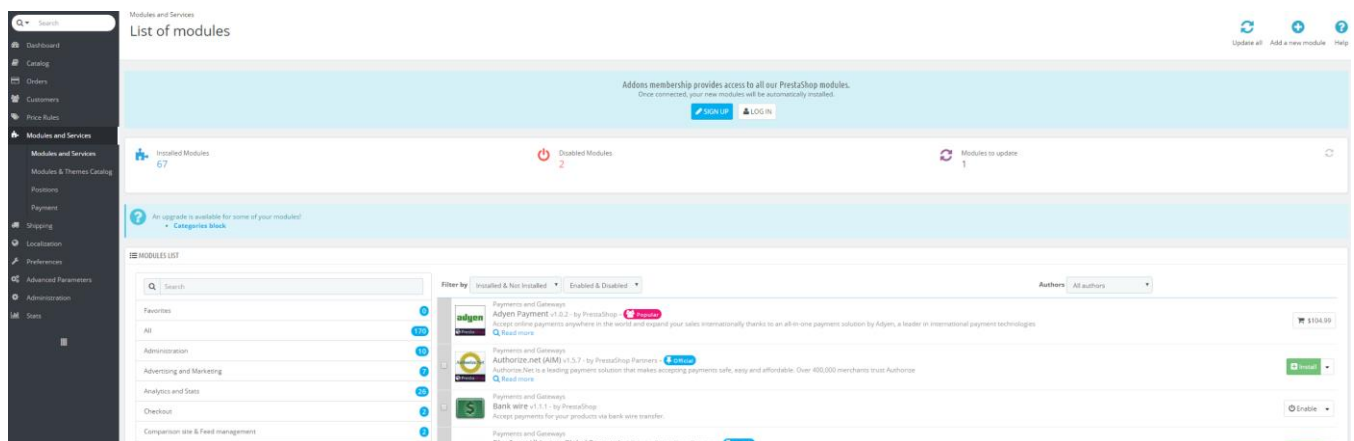

Through the partnership of AltaPay and WooCommerce, we have made it much easier for you as merchant/developer to receive secure payments in your web shop. AltaPay is fully integrated with the WooCommerce platform via a plug-in. All you have to do is to install the plug-in, which will only take a few minutes to complete. We will show you how to complete the installation through a step-by-step guide. Follow this guide to start accepting payments globally.

About AltaPay	8

Instalation

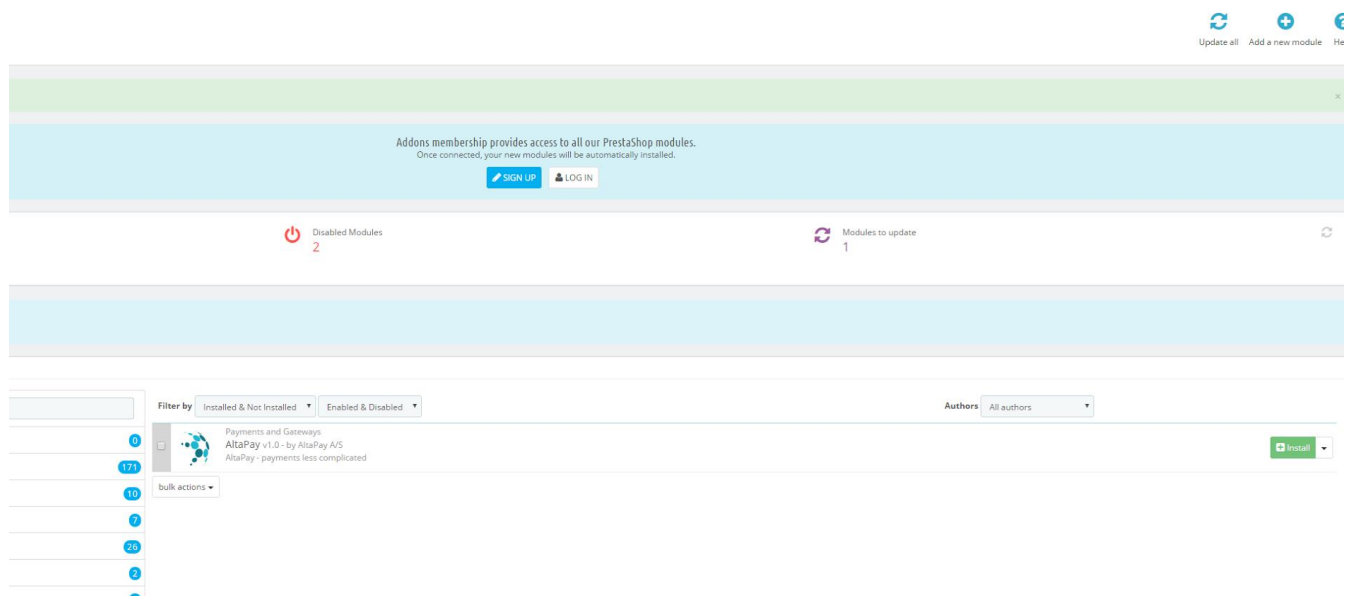

To install the AltaPay module go to 'Modules And Services' -> 'Modules And Services' and click on "Add a new module" from the top-right corner.

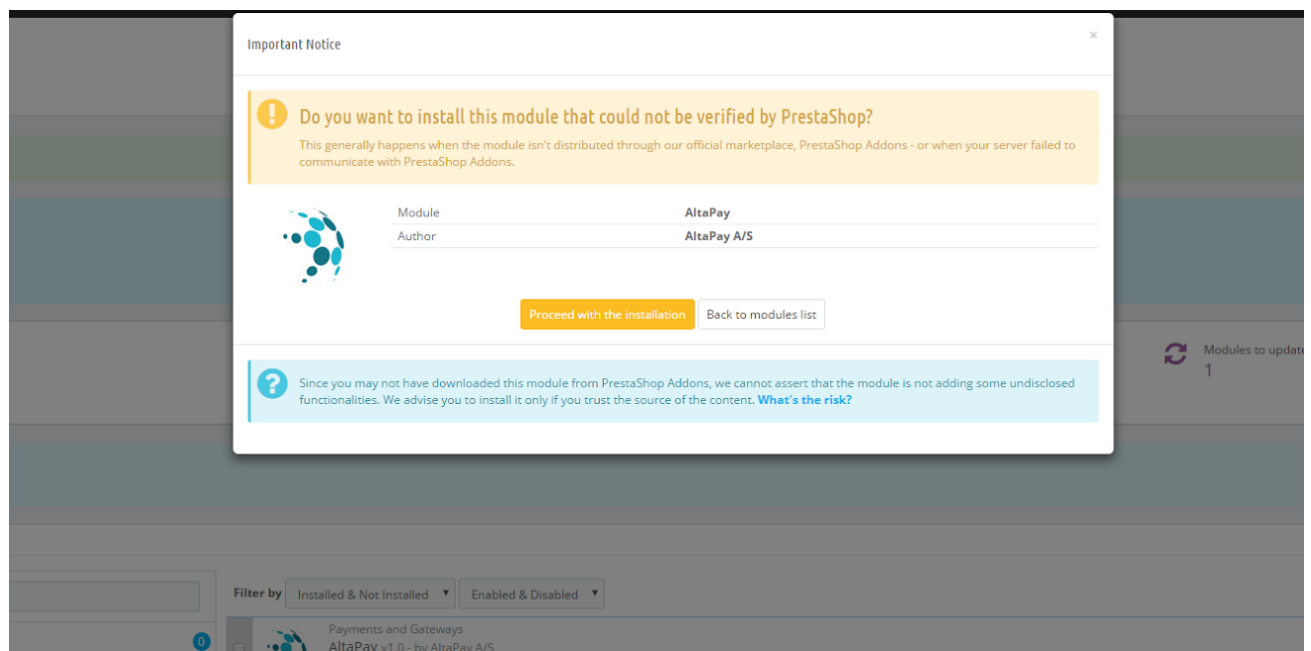

Now click on "Choose a file" from the "Add a new module" tab and find the Altapay.zip file. When you chose the file, click on "Upload the module".

The module is now successfully imported. To finalize the installation find the AltaPay module in the modules list and click on “Install” to the right of the module.

A window will open - click on “Proceed with the installation”. When it’s done a green bar will be visible and state that the module has been successfully installed.

Configuration

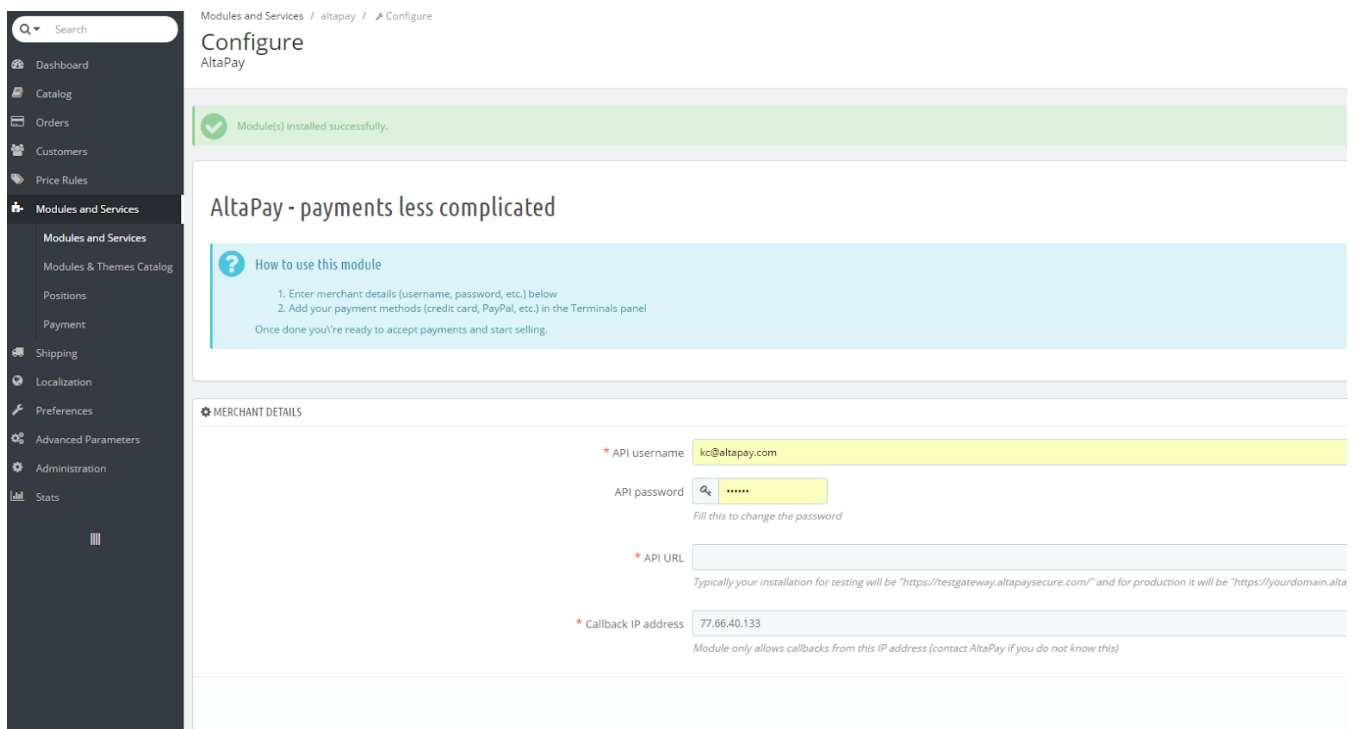

To configure the module you would need your AltaPay gateway credentials:

- API username: This is an e-mail-address
- API password: Have been provided to you by the AltaPay Customer Care team.
- API url: This url will also have been provided to you. For testing please use ["https://testgateway.altapaysecure.com"](https://testgateway.altapaysecure.com)

Go to 'Modules and Services' -> 'Modules and Services' and find the AltaPay module. This can be done by searching for 'AltaPay' or go to 'Payment and Gateways' and find the AltaPay module.

Click on 'Configure' for the AltaPay module.

Now you can enter the credentials for the API user and URL. The default value for the 'Callback IP address' doesn't need to be changed.

Modules and Services / altapay / Configure

Configure

AltaPay

Module(s) installed successfully.

AltaPay - payments less complicated

How to use this module

1. Enter merchant details (username, password, etc.) below
2. Add your payment methods (credit card, PayPal, etc.) in the Terminals panel

Once done you're ready to accept payments and start selling.

MERCHANT DETAILS

* API username

API password
Fill this to change the password

* API URL

Typically your installation for testing will be "https://testgateway.altapaysecure.com" and for production it will be "https://yourdomain.altapay.com"

* Callback IP address
Module only allows callbacks from this IP address (contact AltaPay if you do not know this)

You shall now set up the terminals. At the AltaPay module configuration page, at the bottom you find a list of "Terminals". There is a plus sign which you would need to click on in order to add a new terminal.

[Search](#)

When setting up a terminal you have to select the icon and name that is going to be shown in the check flow. The currency must correspond with the currency on the terminal at AltaPay. The payment type indicates if the money would be captured on reservation ('Authorize and capture') or the merchant would have to capture, when delivering the goods.

This is a beta, and bugs can occur. Should you therefore encounter errors or other issues, please contact our support at support@altapay.com.

Troubleshooting

1. PHP Warning: Input variables exceeded 1000. To increase the limit change `max_input_vars` in `php.ini`.

For orders that contain too many products, this PHP warning may be issued. You will have to edit your `php.ini` file and restart your server.

The variable that you must change is called `max_input_vars`. This is the maximum number of variables that can be sent in a request. You can change it, for example, to 3000. The default is 1000.

2. Parameters: `description/unitPrice/quantity` are required for each orderline, but was not set for line: xxxx

The same problem as above. The request is being truncated because the number of variables are exceeding the `max_input_vars` limit.
